Terminology and Notation

- Configuration Space / Background \mathbb{R}^m
with coordinates (x^i) , $i = 1, 2, \dots, m$.
In 2D, we may set $x^1 = x$, $x^2 = y$.
- Phase Space / Cotangent Bundle $T^*\mathbb{R}^m$
with coordinates (x^i, q_i) , $i = 1, 2, \dots, m$
(q 's are fibre coordinates).
- Use Einstein summation convention throughout.

(Contact) Monge–Ampère Equations

- Monge–Ampère (MA) Equations are non-linear second-order PDEs which are quasi-linear w.r.t. second order partial derivatives, up to determinants of the Hessian or its minors.
- In two dimensions, they take the form

$$A\psi_{xx} + 2B\psi_{xy} + C\psi_{yy} + D(\psi_{xx}\psi_{yy} - \psi_{xy}^2) + E = 0$$

where A, B, \dots, E can depend on $x, y, \psi, \psi_x, \psi_y$ non-linearly.

- If A, B, \dots, E do not depend on ψ , we have a symplectic Monge–Ampère equation.

4. Higher Dimensions and Curved Backgrounds

5. Summary and Outlook

Monge–Ampère Structures and Solutions

- ▶ A Monge–Ampère Structure is a triple $(T^*\mathbb{R}^m, \omega, \alpha)$ with
 - ☞ $\omega \in \Omega^2(T^*\mathbb{R}^m)$ symplectic, e.g. $\omega = dq_i \wedge dx^i$,
 - ☞ $\alpha \in \Omega^m(T^*\mathbb{R}^m)$ is ω -effective, i.e. $\alpha \wedge \omega = 0$,

We call α the Monge–Ampère Form. [Banos 2002]

- ▶ A Generalised Solution to a MA equation, w.r.t. a MA structure, is a submanifold $L \hookrightarrow T^*\mathbb{R}^m$ s.t.
 - ☞ L is Lagrangian, i.e. $\dim(L) = m$ and $\omega|_L = 0$.
 - ☞ α vanishes on L , i.e. $\alpha|_L = 0$.

2. Pressure, Vorticity, and Strain in Incompressible Fluids

3. Monge–Ampère Geometry of 2D Incompressible Flows

4. Higher Dimensions and Curved Backgrounds

5. Summary and Outlook

- ▶ Consider $L = d\psi$ with coordinates $(x^i, \partial_i \psi)$ for some $\psi \in \mathcal{C}^\infty(\mathbb{R}^m)$.
- ▶ Trivially Lagrangian for canonical ω as $\omega|_{d\psi} = 0$.
- ▶ The condition $\alpha|_{d\psi} = 0$ corresponds to a MA equation, with classical solution ψ . [Lychagin 1979]
- ▶ The projection $\pi : L \rightarrow \mathbb{R}^m$ is a diffeomorphism.

1. A Review of Monge–Ampère Geometry
2. Pressure, Vorticity, and Strain in Incompressible Fluids
3. Monge–Ampère Geometry of 2D Incompressible Flows
4. Higher Dimensions and Curved Backgrounds
5. Summary and Outlook

The ω -effective MA forms for 2D background (4D phase space) are

$$\alpha = A dq_1 \wedge dx^2 + B (dx^1 \wedge dq_1 + dq_2 \wedge dx^2) \\ + C dx^1 \wedge dq_2 + D dq_1 \wedge dq_2 + E dx^1 \wedge dx^2$$

Imposing that $\alpha|_{d\psi} = 0$ yields $(x^1 = x, x^2 = y, \text{ and } q_i = \partial_i \psi)$

$$A\psi_{xx} + 2B\psi_{xy} + C\psi_{yy} + D(\psi_{xx}\psi_{yy} - \psi_{xy}^2) + E = 0$$

This correspondence is a bijection – unique MA form in ω -effective class.

The Pfaffian of a Monge–Ampère Form

- The Pfaffian of α is defined by $\alpha \wedge \alpha =: f\omega \wedge \omega$ and in 2D, is given by $f = AC - B^2 - DE$.
- Hence, the MA equation $\alpha|_{d\psi} = 0$ is
 - elliptic* $\Leftrightarrow f > 0$.
 - hyperbolic* $\Leftrightarrow f < 0$.
 - parabolic* $\Leftrightarrow f = 0$.
- Two MA forms (hence equations) α_1, α_2 are locally equivalent if there exists a local symplectomorphism $F : (T^*\mathbb{R}^2, \omega, \alpha_1) \rightarrow (T^*\mathbb{R}^2, \omega, \alpha_2)$ such that $F^*\alpha_2 = \alpha_1$.

5. Summary and Outlook

The Lychagin–Rubtsov Theorem and Equivalence

- [Lychagin et al. 1993] define the endomorphism of vector fields $J : \mathfrak{X}(T^*\mathbb{R}^2) \rightarrow \mathfrak{X}(T^*\mathbb{R}^2)$ by

$$\frac{1}{\sqrt{|f|}}\alpha(\cdot, \cdot) =: \omega(J\cdot, \cdot)$$

$f > 0 \Leftrightarrow J$ is almost complex ($J^2 = -1$)

$f < 0 \Leftrightarrow J$ is almost para-complex ($J^2 = 1$)

- The Lychagin–Rubtsov theorem states t.f.a.e:

☞ $d\left(\frac{1}{\sqrt{|f|}}\alpha\right) = 0.$

☞ $\alpha|_{d\psi = 0}$ is locally equivalent to $\Delta\psi = 0$ or $\square\psi = 0.$

☞ J is integrable.

4. Higher Dimensions and Curved Backgrounds

5. Summary and Outlook

The Navier–Stokes Equations, Vorticity, and Strain

- Homogeneous, Incompressible Navier–Stokes on \mathbb{R}^m background:

$$\partial_t v = -(v \cdot \nabla)v - \nabla p + \nu \Delta v \quad (-c). \quad (*)$$

- Continuity equation is then $\nabla \cdot v = 0$ and applying ∇ to $(*)$ yields:

$$\Delta p \quad (+\nabla \cdot c) = \zeta_{ij} \zeta^{ij} - S_{ij} S^{ij}.$$

where $\zeta_{ij} = \frac{1}{2}(\nabla_j v_i - \nabla_i v_j)$ and $S_{ij} = \frac{1}{2}(\nabla_j v_i + \nabla_i v_j)$.

- Vorticity term dominates $\Leftrightarrow \Delta p > 0$.
Strain term dominates $\Leftrightarrow \Delta p < 0$.

1. A Review of Monge–Ampère Geometry
2. Pressure, Vorticity, and Strain in Incompressible Fluids
3. Monge–Ampère Geometry of 2D Incompressible Flows
4. Higher Dimensions and Curved Backgrounds
5. Summary and Outlook

- ▶ In 2D, solving $\nabla \cdot v = 0$ yields a stream function ψ with $v_1 = -\psi_y$ and $v_2 = \psi_x$.
- ▶ Pressure equation is then a Monge–Ampère equation for ψ :

$$\Delta p = 2 (\psi_{xx}\psi_{yy} - \psi_{xy}^2) .$$

- ▶ *Vorticity dominates* $\Leftrightarrow \Delta p > 0 \Leftrightarrow$ *Elliptic equation.*
Strain dominates $\Leftrightarrow \Delta p < 0 \Leftrightarrow$ *Hyperbolic equation.*
No dominance $\Leftrightarrow \Delta p = 0 \Leftrightarrow$ *Parabolic equation.*
[Weiss 1991, Larchevêque 1993]

1. A Review of Monge–Ampère Geometry
2. Pressure, Vorticity, and Strain in Incompressible Fluids
3. Monge–Ampère Geometry of 2D Incompressible Flows
4. Higher Dimensions and Curved Backgrounds
5. Summary and Outlook

- The pressure equation $\Delta p = 2(\psi_{xx}\psi_{yy} - \psi_{xy}^2)$ is recovered from

$$\alpha = dq_1 \wedge dq_2 - \frac{1}{2}\Delta p dx^1 \wedge dx^2,$$

- Pfaffian is $f = \frac{1}{2}\Delta p$, hence:

Vorticity dominates $\Leftrightarrow \Delta p > 0 \Leftrightarrow f > 0 \Leftrightarrow$ *Elliptic.*

Strain dominates $\Leftrightarrow \Delta p < 0 \Leftrightarrow f < 0 \Leftrightarrow$ *Hyperbolic.*

No dominance $\Leftrightarrow \Delta p = 0 \Leftrightarrow f = 0 \Leftrightarrow$ *Parabolic*

- The Lychagin–Rubtsov theorem says $\Delta p = 2(\psi_{xx}\psi_{yy} - \psi_{xy}^2)$ is locally equivalent to $\Delta\psi = 0$ or $\square\psi = 0$ iff Δp is constant.

5. Summary and Outlook

The Lychagin–Rubtsov Metric

- For choice of $K \in \Omega^2(T^*\mathbb{R}^2)$, we define the Lychagin–Rubtsov metric $\hat{g}(\cdot, \cdot) := -K(J\cdot, \cdot)$ [Roulstone et al. 2001]:

$$\hat{g} = \begin{pmatrix} fI_2 & 0 \\ 0 & I_2 \end{pmatrix}$$

- The pull-back of this metric to classical solution $L = d\psi$ is

$$\hat{g}|_{d\psi} = \zeta \begin{pmatrix} \psi_{xx} & \psi_{xy} \\ \psi_{xy} & \psi_{yy} \end{pmatrix}$$

where $\zeta = \Delta\psi$.

Summary Table

Dominance	Vorticity	Strain	None
Δp	> 0	< 0	$= 0$
f	> 0	< 0	$= 0$
$\alpha _{d\psi} = 0$	Elliptic	Hyperbolic	Parabolic
J^2	-1	1	Singular
\hat{g}	Riemannian (4, 0)	Kleinian (2, 2)	Degenerate**
$\hat{g} _{d\psi}$	Riemannian (2, 0)	Kleinian (1, 1)*	Degenerate**

*Except when $\zeta = 0$, in which case it is degenerate.

**Degeneracies when $\Delta p = 0$ correspond to singularities of scalar curvature – they persist under coordinate changes.

Topology of 2D Vortices

- For simply connected regions Σ of 2D flows on which $\Delta p > 0$ and with boundary given by a closed stream-line, all streamlines within Σ are also closed (and convex). [Larchevêque 1993]
- Σ is topologically a disc [$\chi(\Sigma) = \chi(d\psi(\Sigma)) = 1$] and Gauß–Bonnet theorem on $L = d\psi(\Sigma)$ is:

$$\int_{d\psi(\partial\Sigma)} ds \kappa(x(s)) = 2\pi - \int_{d\psi(\Sigma)} \text{vol}_{d\psi(\Sigma)} R(\hat{g}|_{d\psi})$$

- The mean curvature of the boundary of a ‘vortex’ is described by gradients of vorticity and strain.

5. Summary and Outlook

A Jacobi System Formulation?

- Rather than working with the stream function, use velocity directly. Consider L with coordinates $(x^i, v_i(x))$.
- $\omega|_L = 0$ no longer trivial and implies vorticity vanishes. We need a different symplectic form:

$$\varpi = dq_i \wedge \star(dx^i)$$

such that $\varpi|_L = 0$ gives $\nabla \cdot v = 0$.

- Our MA form can be written

$$\alpha = \frac{1}{2} dq_i \wedge dq_j \wedge \star(dx^i \wedge dx^j) - \frac{1}{2} \Delta p \text{vol}_m$$

and $\alpha|_L = 0$ yields $\Delta p = \zeta_{ij} \zeta^{ij} - S_{ij} S^{ij} = 2 \det(J(v, x))$.

Towards Multi-symplectic Monge–Ampère Systems

GDR GDM Meeting

Lewis Napper

- ▶ A k -Plectic Form is a closed and non-degenerate $\varpi \in \Omega^{k+1}(T^*\mathbb{R}^m)$. [Cantrijn et al. 2009]
- ▶ A (Higher) Monge–Ampère Structure will be a triple $(T^*\mathbb{R}^m, \varpi, \alpha)$ where ϖ is $(m - 1)$ -plectic (no effectiveness condition yet).
- ▶ Generalised Solutions are now submanifolds $L \hookrightarrow T^*\mathbb{R}^m$ satisfying $\varpi|_L = 0$ and $\alpha|_L = 0$ (not necessarily Lagrangian).
- ▶ We focus on L with coordinates $(x^i, v_i(x))$, diffeomorphic to \mathbb{R}^m , in lieu of classical solutions.

1. A Review of Monge–Ampère Geometry

2. Pressure, Vorticity, and Strain in Incompressible Fluids

3. Monge–Ampère Geometry of 2D Incompressible Flows

4. Higher Dimensions and Curved Backgrounds

5. Summary and Outlook

The Lychagin–Rubtsov Metric in Higher Dimensions

- Can again define a metric $\hat{g}(\cdot, \cdot) = -K(J\cdot, \cdot)$ on $T^*\mathbb{R}^m$ of the form

$$\hat{g} = \begin{pmatrix} fI_m & 0 \\ 0 & I_m \end{pmatrix}.$$

- For $A_{ij} = \nabla_j v_i$, the pullback metric is

$$(\hat{g}|_L)_{ij} = A^k{}_i A_{kj} - \frac{1}{2} \delta_{ij} A_{kl} A^{lk}.$$

- In general, signature change of $\hat{g}|_L$ does not coincide with sign change in f — more complicated relationship.

1. A Review of Monge–Ampère Geometry
2. Pressure, Vorticity, and Strain in Incompressible Fluids
3. Monge–Ampère Geometry of 2D Incompressible Flows
4. Higher Dimensions and Curved Backgrounds
5. Summary and Outlook

- No Gauss–Bonnet Theorem in odd dimensions – how to extract topological information?
- Let $\theta = q_i dx^i$ be the tautological form. Then the helicity density is

$$(\theta \wedge \omega)|_L = v_i \zeta^i dx^1 \wedge dx^2 \wedge dx^3$$

- Under ideal conditions, helicity is an invariant quantity and vorticity is conserved.
- Helicity can be related to topological quantities from knot theory i.e. the Gauss linking number, Călugăreanu invariant, and Jones Polynomial [Liu and Ricca 2012, Ricca and Moffatt 1992].

1. A Review of Monge–Ampère Geometry

2. Pressure, Vorticity, and Strain in Incompressible Fluids

3. Monge–Ampère Geometry of 2D Incompressible Flows

4. Higher Dimensions and Curved Backgrounds

5. Summary and Outlook

- On a Riemannian manifold (M, g) , the approach is broadly the same:

$$\Delta p + R_{ij}v^i v^j \quad (+\nabla_i c^i) = \zeta_{ij}\zeta^{ij} - S_{ij}S^{ij}.$$

- Schematically take

$$dq_i \rightarrow dq_i - dx^j \Gamma_{ij}^k q_k.$$

$$I \rightarrow g.$$

$$f = \frac{1}{2}\Delta p \rightarrow f = \frac{1}{2}(\Delta p + R^{ij}q_i q_j).$$

- Geometric justification for Weiss criterion for equation type still applies on a manifold, e.g. \mathbb{S}^2 [Napper et al. 2023].

Navier–Stokes equations in spherical geometry describe ocean/atmosphere dynamics (Joshua Stevens - NASA Earth Observatory)

1. A Review of Monge–Ampère Geometry
2. Pressure, Vorticity, and Strain in Incompressible Fluids
3. Monge–Ampère Geometry of 2D Incompressible Flows
4. Higher Dimensions and Curved Backgrounds
5. Summary and Outlook

- We introduced MA geometry as a tool for studying the Poisson equation for the pressure of an incompressible flow.
- We provided a geometric validation for the Weiss–Okubo criterion and showed how the Lychagin–Rubtsov metric could be used to generalise this to flows in higher dimensions/on curved background.
- We highlighted select results concerning solutions, vortices, and their topologies from the wider framework laid out by [N. et al. 2023].

1. A Review of Monge–Ampère Geometry
2. Pressure, Vorticity, and Strain in Incompressible Fluids
3. Monge–Ampère Geometry of 2D Incompressible Flows
4. Higher Dimensions and Curved Backgrounds
5. Summary and Outlook

- Generalised solutions may have non-immersive projections (Arnold's Singularities) and contain the multivalued solutions.

See [Ichikawa et al. 2007, Vinogradov 1973]

- In semi-geostrophic theory, these produce additional degeneracy of $\hat{g}|_L$ and type change, which represent weather fronts.

[D'Onofrio et al. 2023]

- The geometry of classical solutions models flows with elliptic vortices, vortex tubes, and lines. Perhaps singular locus of projections could be used to model vortex sheets.

1. A Review of Monge–Ampère Geometry
2. Pressure, Vorticity, and Strain in Incompressible Fluids
3. Monge–Ampère Geometry of 2D Incompressible Flows
4. Higher Dimensions and Curved Backgrounds
5. Summary and Outlook

- Can one make precise the notion of ‘Higher’ Monge–Ampère equations? What do we replace effectiveness and Lagrangian with?
- Is it possible to encode dynamics as well as kinematics? Could the vorticity equation

$$\partial_t \zeta + \nabla(\zeta \cdot v) - \nu \Delta \zeta = 0$$

be used as a (Ricci-like) flow equation for the solutions L ?

- .[Lychagin et al. 1993, Banos. 2003] respectively classify 2D and 3D MA equations using integrability of a (para-)complex structure J (and the metric \hat{g}). Can we use generalised complex structures to classify ‘higher’ Monge–Ampère equations?
